### Matrix Algebra – A Minimal Introduction

### James H. Steiger

#### Department of Psychology and Human Development Vanderbilt University

### Multilevel Regression Modeling, 2009

# Matrix Algebra — A Minimal Introduction

- 1 Why Matrix Algebra?
  - The Linear Combination
- 2 Basic Definitions
  - A Matrix
  - Matrix Notation
  - Matrix Terminology Types of Matrices

Matrix Algebra

- 3 Matrix Operations
  - Matrix Addition and Subtraction
  - Scalar Multiple
  - Scalar Product
  - Matrix Transposition
  - Matrix Multiplication
  - Matrix Inversion
  - Trace of a Square Matrix

The Linear Combination

## Definition of a Linear Combination

### Definition

- Suppose you have two predictors,  $x_1$  and  $x_2$
- The variable  $\hat{y} = b_1 x_1 + b_2 x_2$  is said to be a *linear* combination of  $x_1$  and  $x_2$
- $b_1$  and  $b_2$  are the *linear weights* which, in a sense, define a particular linear combination

Image: Image:

The Linear Combination

## Linear Combinations in Regression

- As we just saw, a linear model for y is a linear combination of one or more predictor variables, plus an intercept and an error term
- Statistical laws that generally apply to linear combinations must then also apply to linear models

The Linear Combination

### Linear Combinations in Regression

- As we just saw, a linear model for y is a linear combination of one or more predictor variables, plus an intercept and an error term
- Statistical laws that generally apply to linear combinations must then also apply to linear models

The Linear Combination

# Linear Combinations in Regression

- As we just saw, a linear model for y is a linear combination of one or more predictor variables, plus an intercept and an error term
- Statistical laws that generally apply to linear combinations must then also apply to linear models

The Linear Combination

# Linear Combinations in Regression

- Regression models often contain *many* predictors, so we might well profit by a notation that allows us to talk about linear combinations with any number of predictors
- Matrix algebra provides mathematical tools and notation for discussing linear models compactly

The Linear Combination

## Linear Combinations in Regression

- Regression models often contain *many* predictors, so we might well profit by a notation that allows us to talk about linear combinations with any number of predictors

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

# Definition of A Matrix

#### Definition

• A *matrix* is defined as an ordered array of numbers, of dimensions *p*,*q*.

#### Example

$$\mathbf{A} = \left(\begin{array}{rrr} 2 & 1 & 4 \\ 7 & 1 & 8 \\ 6 & 6 & 0 \end{array}\right)$$

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Image: A math a math

# Matrix Notation

#### Notation

• My standard notation for a matrix  ${\bf A}$  of order  $p,\,q$  will be:

- Note that in my notation, matrices and vectors are in boldface
- Gelman and Hill, presents matrices and vectors in math-italics, but their meaning will usually be clear from context

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Image: A matrix and a matrix

# Matrix Notation

### Notation

• My standard notation for a matrix  $\mathbf{A}$  of order p, q will be:

### $_{p}\mathbf{A}_{q}$

- Note that in my notation, matrices and vectors are in boldface
- Gelman and Hill, presents matrices and vectors in math-italics, but their meaning will usually be clear from context

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

- Gelman and Hill, presents matrices and vectors in math-italics, but their meaning will usually be clear from context

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Matrix Notation Elements of a Matrix

### Matrix Elements

- The individual numbers in a matrix are its *elements*
- We use the following notation to indicate that "A is a matrix with elements  $a_{ij}$  in the i, jth position"

# $\mathbf{A} = \{a_{ij}\}$

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Matrix Notation Elements of a Matrix

### Matrix Elements

### • The individual numbers in a matrix are its *elements*

• We use the following notation to indicate that "A is a matrix with elements  $a_{ij}$  in the i, jth position"

 $\mathbf{A} = \{a_{ij}\}$ 

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Matrix Notation Elements of a Matrix

### Matrix Elements

- The individual numbers in a matrix are its *elements*
- We use the following notation to indicate that "A is a matrix with elements  $a_{ij}$  in the i, jth position"

$$\mathbf{A} = \{a_{ij}\}$$

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

### Matrix Notation Subscript Notation

#### Subscript Notation

- When we refer to element  $a_{ij}$ , the *first* subscript will refer to the *row position* of the elements in the array
- The *second* subscript (regardless of which letter is used in this position) will refer to the column position.
- Hence, a typical matrix  ${}_{p}\mathbf{A}_{q}$  will be of the form:

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1q} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2q} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3q} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{p1} & a_{p2} & a_{p3} & \cdots & a_{pq} \end{pmatrix}$$

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

### Matrix Notation Subscript Notation

#### Subscript Notation

- When we refer to element  $a_{ij}$ , the *first* subscript will refer to the *row position* of the elements in the array
- The *second* subscript (regardless of which letter is used in this position) will refer to the column position.
- Hence, a typical matrix  ${}_{p}\mathbf{A}_{q}$  will be of the form:

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1q} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2q} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3q} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{p1} & a_{p2} & a_{p3} & \cdots & a_{pq} \end{pmatrix}$$

A Matrix Matrix Notation Matrix Terminology — Types of Matrices

Matrix Addition and Subtraction Scalar Multiple Scalar Product Matrix Transposition Matrix Multiplication Matrix Inversion Trace of a Square Matrix

## Properties of Matrix Addition

Matrix addition has some important mathematical properties, which, fortunately, mimic those of scalar addition and subtraction. Consequently, there is little "negative transfer" involved in generalizing from the scalar to the matrix operations.

#### Properties of Matrix Addition

For matrices A, B, and C, properties include:

- Associativity.  $\mathbf{A} + (\mathbf{B} + \mathbf{C}) = (\mathbf{A} + \mathbf{B}) + \mathbf{C}$
- Commutativity.  $\mathbf{A} + \mathbf{B} = \mathbf{B} + \mathbf{A}$

# Matrix Transposition

*Transposing* a matrix is an operation which plays a very important role in multivariate statistical theory. The operation, in essence, switches the rows and columns of a matrix.

#### Matrix Transposition

Let  ${}_{p}\mathbf{A}_{q} = \{a_{ij}\}$ . Then the *transpose* of **A**, denoted **A**', is defined as

$$_{q}\mathbf{A}_{p}^{\prime}=\left\{ a_{ji}\right\}$$

#### Example

If 
$$_{2}\mathbf{A}_{3} = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$$
, then  $_{3}\mathbf{A'}_{2} = \begin{pmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{pmatrix}$

# Matrix Multiplication Conformability

- That is, the matrix product **AB** need not be the same as the matrix product **BA**.
- Indeed, the matrix product **AB** might be well-defined, while the product **BA** might not exist.
- When we compute the product **AB**, we say that **A** is *post-multiplied* by **B**, or that **B** is *premultiplied* by **A**

# Matrix Multiplication Dimension of a Matrix Product

If two or more matrices are conformable, there is a strict rule for determining the dimension of their product

- The product  ${}_{p}\mathbf{A}_{q}\mathbf{B}_{r}$  will be of dimension  $p \times r$
- More generally, the product of any number of conformable matrices will have the number of rows in the leftmost matrix, and the number of columns in the rightmost matrix.
- For example, the product  ${}_{p}\mathbf{A}_{q}\mathbf{B}_{r}\mathbf{C}_{s}$  will be of dimensionality  $p \times s$

# Matrix Multiplication Three Approaches

- Matrix multiplication might well be described as the key operation in matrix algebra
- What makes matrix multiplication particularly interesting is that there are numerous lenses through which it may be viewed
- We shall examine 3 ways of "looking at" matrix algebra
- All of them rely on *matrix partitioning*, which we'll examine briefly in the next 2 slides

## Matrix Multiplication The Row by Column Approach

#### Partitioning a Matrix into Rows

- Any  $p \times q$  matrix **A** may be partitioned into as a set of p rows
- $\bullet\,$  For example, the  $2\times 3$  matrix

$$\left(\begin{array}{rrrr}1&2&3\\3&3&3\end{array}\right)$$

may be thought of as two rows,  $(1 \ 2 \ 3)$  and  $(3 \ 3 \ 3)$  stacked on top of each other

• We have a notation for this. We write

$$\mathbf{A} = \left(\begin{array}{c} \mathbf{a}_1' \\ \mathbf{a}_2' \end{array}\right)$$

#### Linear Combination of Columns

• Consider once again the product

$$\left(\begin{array}{rrr}2&7\\3&5\end{array}\right)\,\left(\begin{array}{rrr}1&2&1\\2&2&3\end{array}\right)$$

- The second column of the product is produced by applying the linear weights 2 and 2 to the columns of the first matrix
- The result is

$$2\left(\begin{array}{c}2\\3\end{array}\right)+2\left(\begin{array}{c}7\\5\end{array}\right)=\left(\begin{array}{c}18\\16\end{array}\right)$$

Matrix Addition and Subtractic Scalar Multiple Scalar Product Matrix Transposition Matrix Multiplication Matrix Inversion Trace of a Square Matrix

## Matrix Multiplication Linear Combination of Rows Approach

- When you pre-multiply a matrix **B** by a matrix **A**, each row of **A** generates, in effect, a row of the product **AB**
- $\bullet\,$  Each row of  ${\bf A}$  contains a set of linear weights
- These linear weights are applied to the rows of **B** to produce a single row vector of numbers.

# Matrix Multiplication Mathematical Properties

The following are some key properties of matrix multiplication:

Mathematical Properties of Matrix Multiplication

• Associativity.

 $(\mathbf{AB})\mathbf{C} = \mathbf{A}(\mathbf{BC})$ 

- Not generally commutative. That is, often  $AB \neq BA$ .
- Distributive over addition and subtraction.

 $\mathbf{C}(\mathbf{A}+\mathbf{B})=\mathbf{C}\mathbf{A}+\mathbf{C}\mathbf{B}$ 

- Assuming it is conformable, the identity matrix I functions like the number 1, that is  ${}_{p}\mathbf{A}_{q}\mathbf{I}_{q} = \mathbf{A}$ , and  ${}_{p}\mathbf{I}_{p}\mathbf{A}_{q} = \mathbf{A}$ .
- AB = 0 does not necessarily imply that either A = 0 on B = 0.

#### Example

In the previous numerical example, we had

$$\mathbf{A} = \left(\begin{array}{cc} 2 & 1\\ 1 & 1 \end{array}\right), \text{ and } \mathbf{b} = \left(\begin{array}{cc} 5\\ 3 \end{array}\right)$$

It is easy to see that

$$\mathbf{A}^{-1} = \left(\begin{array}{cc} 1 & -1 \\ -1 & 2 \end{array}\right)$$

and so

$$\mathbf{x} = \begin{pmatrix} 1 & -1 \\ -1 & 2 \end{pmatrix} \begin{pmatrix} 5 \\ 3 \end{pmatrix} = \begin{pmatrix} 2 \\ 1 \end{pmatrix}$$
